StatKeyEval

A Statistical Framework for Dynamic Keyword Extraction, Evaluation, and Assessment Automation

Aim:

To implement an API for the available research paper models to give the answers for the short answers.

Research Paper:

Title: *Feature Engineering and Ensemble-Based Approach for Improving Automatic Short-Answer Grading Performance*

Authors: Archana Sahu and Plaban Kumar Bhowmick.

Conference/Journal: Educational Data Mining Conference (2018)

Datasets:

1. UNT Dataset
2. SciEntsBank Dataset
3. Beetle Dataset

[illegible]

- Relevance(W) is the final importance score for word W in the lexical extraction process

- FreqRatio(W) is the ratio of word W's frequency in relevant contexts to its frequency in irrelevant contexts plus a smoothing constant δ : frequency in relevant / (frequency in irrelevant + δ)
- InverseDistance(W) is the reciprocal of the average distance to other key terms plus 1: $1/(\text{average distance to other key terms} + 1)$
- Specificity(W) is a measure of word uniqueness calculated as $\log(\text{total corpus words} / \text{document frequency of W})$
- α , β , and γ are tunable exponential parameters that control the influence of each component (typical values: $\alpha=0.5$, $\beta=0.7$, $\gamma=0.4$)

Statistical Function for Keyword Mutation

$$\text{ExpandMetric}(K_1, K_2) = [\text{SymbioticOverlap}(K_1, K_2) \times \text{LogisticDecay}(|K_1|, |K_2|)] \times [1 + \log(1 + \text{SemanticDensity}(K_1 \cap K_2))]$$

Where: • ExpandMetric(K_1, K_2) is the final expansion benefit score between keyword sets

K_1 and K_2

- SymbioticOverlap(K_1, K_2) is the quadratic overlap measure calculated as $|K_1 \cap K_2|^2 / (|K_1| \times |K_2|)$
- LogisticDecay($|K_1|, |K_2|$) is a balanced size similarity function calculated as $2/(1 + \exp(|\text{abs}(|K_1| - |K_2|)/\lambda))$, where λ is a scaling parameter
- SemanticDensity($K_1 \cap K_2$) is the sum of co-occurrence frequencies for all word pairs in the intersection
- $|K_1|$ and $|K_2|$ are the cardinalities (sizes) of the keyword sets
- \log is the natural logarithm function
- \exp is the exponential function

Statistical Functions for Score calculation

$$\text{AdjustedMetric}(R) = M \times [1 - e^{-R/\tau}] \times [1 + \beta \times \sin\left(\frac{\pi \times R}{2M}\right)]$$

Where:

- AdjustedMetric(R) is the final calibrated value after quantization to the nearest 0.5
- R is the original raw measurement
- M is the maximum threshold value
- τ is a scaling coefficient governing the saturation rate
- β is a modulation parameter controlling oscillation intensity
- e is the base of the natural logarithm

- sin is the sine function

Code for Performance Graph:

Code:

```
# Load necessary libraries if (!require("shiny"))

shinyApp(ui = ui, server = server)**RESULT:**

The screenshot displays the 'Student Keyword' Shiny application interface. The browser address bar shows the URL: `http://127.0.0.1:4558/`. The application has a dark sidebar with navigation options: 'Single Analysis' (selected), 'Batch Processing', and 'About'. The main content area is titled 'Student Keyword' and contains the following elements:

- Input Section:**
 - Question:** 'What is the role of a prototype program in problem solving?'
 - Model Answer:** 'To simulate the behaviour of portions of the desired software product.'
 - Model Answer Keywords (Optional, comma-separated):** 'simulate, portions, desired, product, software, behaviour'
- Student Answer:** A text box containing 'simulate, portions, desired, product, software, behaviour'.
- Analyze Response:** A blue button.
- Results Summary:** Three colored boxes showing:
 - 5 WPIES Score** (green box with a star icon)
 - 100% Keyword Similarity** (blue box with a percentage icon)
 - 6 Matching Keywords** (purple box with a checkmark icon)
- Analysis Results:** A section with two tabs: 'Keywords' (selected) and 'Score Details'.
 - Model Answer Keywords:** '[1] "simulate, portions, desired, product, software, behaviour"'
 - Student Answer Keywords:** '[1] "simulate, portions, desired, product, software, behaviour"'

number	Questions	Answers	Texts	Score
1	1.1 What is the role of a prototype program in problem solving?	To simulate the behaviour of portions of the desired software product.	High risk problems are address in the prototype program to make sure that the program is feasible. A prototype may also be used to show a company that the software can be possibly programmed. 	3.5
2	1.1 What is the role of a prototype program in problem solving?	To simulate the behaviour of portions of the desired software product.	To simulate portions of the desired final product with a quick and easy program that does a small specific job. It is a way to help see what the problem is and how you may solve it in the final project.	5
3	1.1 What is the role of a prototype program in problem solving?	To simulate the behaviour of portions of the desired software product.	A prototype program simulates the behaviors of portions of the desired software product to allow for error checking.	4
4	1.1 What is the role of a prototype program in problem solving?	To simulate the behaviour of portions of the desired software product.	Defined in the Specification phase a prototype stimulates the behavior of portions of the desired software product. Meaning, the role of a prototype is a temporary solution until the program itself is refined to be used extensively in problem solving.	5

5	1.1 What is the role of a prototype program in problem solving?	To simulate the behaviour of portions of the desired software product.	It is used to let the users have a first idea of the completed program and allow the clients to evaluate the program. This can generate much feedback including software specifications and project estimations of the total project.	3	3
